Prit Dhanani

AI Engineer: LLM Applications, RAG & Structured Extraction

SUMMARY

M.Sc. AI and Robotics student and Generative AI Engineer (Working Student) at INFINITE Mind GmbH, building Python services that connect language models to enterprise data and tools: RAG with hybrid retrieval and reranking, schema-validated structured outputs and agentic workflows, taken from requirement to testing and deployment with FastAPI, Docker and GitHub Actions. Seeking a part-time working student role in generative AI engineering, 15–20 hours per week alongside my studies.

EXPERIENCE

Generative AI Engineer (Working Student)

Sep 2025 - Present

INFINITE Mind GmbH, Munich

- Designed and deployed enterprise-grade GenAI systems (RAG pipelines, chatbots, agentic workflows) in Python using LangChain, LlamaIndex and FastAPI, improving information retrieval efficiency by 35%.
- Built on-premise LLM adaptation and RAG pipelines that run without external APIs, meeting enterprise privacy and data-residency constraints.
- Built an LLM-powered agentic system for automated content and business-proposal generation using LangChain and Python, reducing manual production time by 95% (hours to under 2 minutes).
- Owned the delivery lifecycle from requirement gathering to deployment for 3 production-ready systems for enterprise clients.

AI Engineer

Oct 2023 - Jul 2024

Woxxin Solution Pvt. Ltd, India

- Fine-tuned open-source LLMs using PyTorch and LoRA on domain-specific datasets, increasing chatbot response accuracy by 22%.
- Owned the complete lifecycle of client-facing AI products as sole engineer, using Azure AI and Azure OpenAI to deliver custom enterprise chatbot solutions.
- Developed and productionised predictive ML models with TensorFlow and scikit-learn using Docker and CI/CD pipelines, shortening deployment cycles by 30%.
- Designed automated data ingestion and preprocessing pipelines, using MLflow for performance tracking and drift detection.

EDUCATION

M.Sc. AI and Robotics

Mar 2025 - ongoing

Hochschule Hof, Bavaria (currently enrolled) - Applied Deep Learning, Generative AI, Advanced AI Applications, Industry 4.0 / Data Management, Predictive Maintenance and Condition Monitoring

B.E. Information Technology

2019 - 2023

Sarvajanik College of Engineering and Technology (GTU), Surat, India - GPA 1.8

ACHIEVEMENTS

ML Hackathon 2.0 – 2nd Place

2023

Awarded second place in a machine learning hackathon

MYSY Scholarship

2019 - 2023

Scholarship for outstanding academic progress during B.E. studies

CERTIFICATIONS

AWS Certified AI Practitioner
Amazon Web Services, Nov 2024
(valid through Nov 2027)

Build enterprise-grade tool ecosystems with MCP and Microsoft Foundry
Microsoft, Oct 2026

Monitoring Production Agents
LangChain Academy, Oct 2026

Hugging Face Agents Course
Hugging Face, Oct 2026

Design advanced prompting strategies for production AI agents
Microsoft, Oct 2026

Design stateful agentic loops with Microsoft Foundry agent service
Microsoft, Oct 2026

TOOLS & PLATFORMS

PyTorch · TRL · Pydantic · JSON Schema · BM25 · sentence-transformers · MLflow · PostgreSQL · SQL · Ollama · Groq · Gemini API · AWS Bedrock · Azure OpenAI · Streamlit · Django · Flask · React · Scikit-learn · CUDA

AVAILABILITY

Working student
Immediately - 15–20 h/week
Remote within Germany
Residence: Hof, Germany

SELECTED PROJECTS: LLM APPLICATIONS, RAG & EVALUATION

Deck Engine: Schema-Constrained, Verifiable LLM Generation (v1.0.0)

- Designed a structured-output architecture that separates deterministic logic from model output: layout selection, chart-type resolution and template cloning run in code, while the LLM supplies only text and data.
- Enforced per-field constraints at three layers (injected into the prompt, enforced as a JSON schema, re-validated after generation) with an "omit, don't invent" rule so the model leaves fields empty rather than fabricating content.
- Implemented a bounded retry loop that feeds exact validation errors back to the model and escalates an item for human review after repeated failure; abstracted three inference backends (Anthropic Claude, Gemini, local Ollama) behind one interface.

Tech: Python 3.13, Pydantic, JSON Schema, python-pptx, Anthropic and Gemini APIs, Ollama.

Production RAG Platform: Hybrid Retrieval, Reranking & Real-Time Evaluation

- Engineered a RAG pipeline combining BM25 sparse search, FAISS dense vector retrieval, query expansion and a cross-encoder reranking layer, improving retrieval accuracy by 35% and reducing hallucinations.
- Designed an ingestion pipeline that parses, cleans and semantically chunks heterogeneous sources (PDF, Markdown, HTML, crawled documentation) into one index with embeddings.
- Integrated an MLflow observability layer tracking retrieval similarity scores, query latency and answer faithfulness against reference queries; applied prompt compression, cutting token payload by 40%.

Tech: LlamaIndex, LangChain, FAISS, BM25, sentence-transformers, FastAPI, Docker, MLflow, PostgreSQL.

Local LLM Training & Optimization Suite: On-Premise SFT and DPO

- Engineered a privacy-preserving local training platform (FastAPI backend, React dashboard) for SFT and DPO alignment of 7B/8B models on a single 16 GB GPU, reducing GPU memory footprint by 60% with NF4/QLoRA, activation checkpointing and paged optimizers.
- Isolated training jobs in subprocesses so 100% of CUDA VRAM is reclaimed on completion; enforced a strict prompt / chosen / rejected data schema with de-duplication and length filtering.

Tech: PyTorch, TRL (SFT/DPO), QLoRA/NF4, Hugging Face Transformers, FastAPI, React, SQLite.

End-to-End MLOps Pipeline with CI/CD

- Built a modular, YAML-configured pipeline (ingestion, schema validation, transformation, training, evaluation) with MLflow experiment tracking on DagsHub, a Flask inference UI, a Dockerfile and GitHub Actions CI/CD.

Tech: Python, MLflow, DagsHub, Flask, Docker, GitHub Actions.

SmartDiet AI: ML Classifier + LLM Meal Planner (team project)

- Contributed to a two-stage system (ML diet-type classifier feeding an LLM meal planner via Groq and Gemini APIs) with a pytest suite and a src/ package structure.
- Identified and documented near-deterministic label leakage in a public health dataset that produced perfect classifier scores, and reported realistic baselines (70–85%) instead of the inflated metric.

Tech: Python, scikit-learn, XGBoost, pytest, Groq and Gemini APIs.

AskToYaana: Deployed AI Recommendation App

- Built and deployed a full-stack LLM-powered skincare recommendation app (Django, LLaMA 3.3 served via Groq, LSTM intent classifier), publicly reachable on Render.

RESEARCH & ACADEMIC WORK

- Conducted a systematic review of Knowledge Graph Embeddings (KGE), evaluating neural and hyperbolic models (KG-BERT, HypHKGE) to identify performance benchmarks for semantic search.
- Implemented the Auto-Encoding Variational Bayes (AEVB) algorithm from the original paper as a PyTorch variational autoencoder prototype with 95% reconstruction accuracy.
- Analysed edge AI architectures at the Siemens Amberg Plant, proposing LLM-integrated factory workflows to optimise its 75% manufacturing automation.
